CIT 140 · Week 4 · Cedar Junction

Validated Requirements Set

Akyba Mallett - Week 4 Requirements Set · Revision 2096

R-01 · functional

Requirement: System must clearly distinguish a held appointment state from a ready appointment state in the intake queue.

Source: W04-S01 · Dana Ruiz

Rationale: Scheduling and intake use " held" for completely different scenarious Awaiting confirmation vs a visitor who arrived but cannot move forward, which will cause confusion and delays.

Acceptance check: Given an appointment is marked as held by scheduling when the vistor arrives at the intake desk, then the system must display visula indicators showing the appointment state held rather than ready.

Priority: Must · **Validation:** Confirmed by Dana Ruiz

Conflict or decision: The system must display reserved and ready as distinct operational states so intake staff can immediately tell if a visitor has arrived but is waiting vs. if their appointment is merely held by scheduling.

R-02 · user

Requirement: The system must provide staff with clear visibilty into status exceptions, including the current condition, and who last updated it, and the next approved step .

Source: W04-S01 · Dana Ruiz

Rationale: Without immediate clarity on status exceptions, staff are forced to make phone calls to figure out the issue while visitors are kept waiting.

Acceptance check: Given a visitors status exception occurs in the queue, when a staff member views the record, the system must display the current condition, the user who changed it and the required step on screen without requiring phone calls.

Priority: Must · **Validation:** Confirmed by Dana Ruiz

Conflict or decision: The system must display reserved and ready as distinct operational states so intake staff can immediately tell if a visitor has arrived but is waiting vs. if their appointment is merely held by scheduling.

R-03 · business

Requirement: The system must require confirmation of clinical readiness before a same day slot can be offereed to a visitor.

Source: W04-S02 · Dr. Lena Okafor

Rationale: A calender opening alone does not guarantee that the clinic is actually prepared or staffed to receive a vistor which prevents scheduling errors.

Acceptance check: an open calendar slot exists, when staff attempt to offer it without readiness confirmation, then the sysem must block the offer until verified

Priority: Must · **Validation:** Confirmed by Dr. Lena Okafor

Conflict or decision: The system must require active confirmation of physical and clinical preparation before a calendar opening can be marked as ready to receive visitors.

R-04 · functional

Requirement: the system must notify authorized staff immediately if clincial readiness status changes after an appt. has been confirmed

Source: W04-S02 · Dr. Lena Okafor

Rationale: Readiness and capacity can shift unexpectedly and staff need real time updates to prevent booking conflicts or delays.

Acceptance check: Given a confirmed appointment has a readiness status change, when the status is updated in the system, then an immediate notifiction must be sent to the assigned staff member

Priority: Must · **Validation:** Confirmed by Dr. Lena Okafor

Conflict or decision: The system must require active confirmation of physical and clinical preparation before a calendar opening can be marked as ready to receive visitors.

R-05 · user

Requirement: The system must ensure that approved communication preferences and support needs persist across all clinic service points without requiring the visitor to repeat them.

Source: W04-S03 · Priya Shah

Rationale: When info doesn't carry over from access to intake, visitors are forced to explain the same needs multiple times after arriving, leading to frustration and delay.

Acceptance check: Given a visitor's communication preference is recorded during initial access, when the visitor arrives at intake, then the system must display those same preferences to staff immediately without re-entry.

Priority: Must · **Validation:** Confirmed by Priya Shah

Conflict or decision: The system must persist approved visitor communication preferences and support needs across all handoffs so visitors do not have to repeat them at every desk.

R-06 · constraint

Requirement: The system must provide an equivalent phone or staff assisted route for individuals who cannot use the online visitor portal.

Source: W04-S03 · Priya Shah

Rationale: Access to essential clinic services cannot depend on a single digital channel, some visitors may lack access/ability to use the portal.

Acceptance check: Given a visitor is unable to use the online portal, when they contact the clinic via phone or staff assistance, then staff must be able to complete the same intake and scheduling steps through an alternative route.

Priority: Must · **Validation:** Confirmed by Priya Shah

Conflict or decision: The system must persist approved visitor communication preferences and support needs across all handoffs so visitors do not have to repeat them at every desk.

R-07 · nonfunctional

Requirement: The system must restrict shared public or staff displays to show only the min operational information necessary for the current step, concealing sensitive visitor details.

Source: W04-S04 · Jordan Kim

Rationale: Staff need enough information to coordinate care, but open displays should not expose private medical or personal details to unauthorized viewers or people nearby.

Acceptance check: Given an appointment or queue record is visible on a shared screen, when a staff member without specialized clearance views the display, then the system must mask sensitive personal details while displaying only the necessary operational status.

Priority: Must · **Validation:** Confirmed by Jordan Kim

Conflict or decision: Shared displays must be restricted to minimum necessary operational information, and an immutable audit log must record all status changes, timestamps, and user identities.

R-08 · functional

Requirement: The system must maintain an immutable audit trail whenever a visitor's status or priority changes, recording the old state, new state, timestamp, and user identifier.

Source: W04-S04 · Jordan Kim

Rationale: A reliable history is critical when status changes occur so the clinic can trace accountability and troubleshoot scheduling errors.

Acceptance check: Given a visitor's status is modified in the system, when an authorized user opens the audit log for that record, then the system must display the precise timestamp, previous status, updated status, and the user who made the change.

Priority: Must · **Validation:** Confirmed by Jordan Kim

Conflict or decision: Shared displays must be restricted to minimum necessary operational information, and an immutable audit log must record all status changes, timestamps, and user identities.

Professional Guidance Assessment

IIBA: IIBA (International Institute of Business Analysis) provides the broad analyst process and standards—such as the BABOK Guide—which structure how we handle needs, stakeholder collaboration, requirements lifecycle management, and solution evaluation.

ISO/IEC/IEEE 29148: Together, they publish ISO/IEC/IEEE 29148, which serves as the professional requirements-engineering standard used to ensure high quality, clear structuring, and robust traceability for technical requirements.

PMI: The Project Management Institute (PMI) focuses primarily on project delivery, scheduling, and resource management, whereas Week 4 focuses specifically on requirements elicitation, quality, and definition rather than overall project execution.

Application: The guidance helped me make R-01 much more clear and checkable by ensuring the requirement focused on the exact stakeholder need distinguishing "held" from "ready" states rather than prematurely choosing interface design buttons.

Prepared in Command Nexus. Canvas remains the official submission point.
